

Methodology Snapshot

The *WJP Rule of Law Index*® is built upon an original conceptual framework, which WJP developed in consultation with academics, legal practitioners, and community leaders around the world.

1. Questionnaires

WJP administers a set of five original questionnaires to experts and the general public. These questionnaires are translated into several languages and adapted to reflect commonly used terms and expressions.

4 Expert Questionnaires

Qualified Respondents' Questionnaires (QRQs)

Every year, WJP invites legal practitioners and academics from around the world to participate in expert surveys covering four disciplines: civil and commercial law, criminal justice, labor law, and public health.

1 Household Questionnaire

General Population Poll (GPP)

Every few years, WJP engages the services of leading local polling companies to conduct surveys of the general public in each country.

2. Codification

WJP maps collected data onto 44 rule of law sub-factors. Final scores are constructed using a five-step process:

1. Codify questionnaire items as numeric values.
2. Produce raw country scores by aggregating the individual responses.
3. Normalize raw scores.
4. Aggregate the scores into sub-factors and factors using simple averages.
5. Produce the final scores and rankings.

3. Testing

The data is subjected to a series of tests to detect significant changes and identify possible biases and errors. The sub-factors are cross-checked against more than 90 third-party sources drawn from local and international organizations.

4. Presentation

Data is organized into country profiles, tables, and figures to facilitate its presentation and interpretation. The full report, key insights, and historical datasets can be accessed on WJP's website: worldjusticeproject.org/index.

5. External Review and Validation

To assess the statistical reliability of our results, WJP periodically invites the Econometrics and Applied Statistics Unit of the European Commission's Joint Research Centre to perform a sensitivity analysis of the Index. This analysis confirms that the *WJP Rule of Law Index* is a reliable tool with statistical coherence and robust structure.

Methodology

The *WJP Rule of Law Index* is the first resource to systematically and comprehensively quantify the rule of law around the world and remains unique in its operationalization of rule of law dimensions into concrete questions.

The *WJP Rule of Law Index 2025* report presents information on eight composite factors that are further disaggregated into 44 specific sub-factors (see page 12 in the full 2025 Index report). Factor 9: Informal Justice is included in the conceptual framework but has been excluded from the aggregated scores and rankings in order to provide meaningful cross-country comparisons.

The country scores and rankings presented in this report are built from more than 550 variables drawn from the assessments of over 215,000 households and 4,100 surveys from legal practitioners and experts. This data covers 143 countries and jurisdictions, making it the most accurate portrayal of the factors that contribute to shaping the rule of law in a country.

Data Sources

To accurately capture the rule of law as it is experienced in practice, each score of the Index is calculated using questions drawn from two original data sources collected by the World Justice Project in each country: a General Population Poll (GPP) and a series of Qualified Respondents' Questionnaires (QRQs). These sources collect up-to-date firsthand

information that is not otherwise available at the global level, constituting the world's most comprehensive dataset of its kind. Each survey captures people-centered data based on the lived experiences of ordinary people and in-country professionals concerning the performance of the state and its agents in terms of the actual operation of the legal framework in their country.

Through the GPP, WJP collects primary data on the public's interactions with a range of pertinent rule of law mechanisms. These topics include people's dealings with the government, the ease of interacting with state bureaucracy, the extent of bribery and corruption, the availability of dispute resolution systems, and the prevalence of common crimes to which they are exposed.

The GPP survey instrument includes 127 perception-based questions and 213 experience-based questions, along with socio-demographic information on all respondents. The questionnaire is translated into local languages, adapted to common expressions, and administered by leading local polling companies using a probability sample of 1,000 respondents.¹ In previous editions of the Index, the poll was conducted in the three largest cities of each country. However, the World Justice Project has updated this methodology to include nationally representative polls. Towards this end, nationally representative polls have thus far been administered in 115 countries and jurisdictions covered in

1. Due to small populations or obstacles to data collection in certain countries and jurisdictions, the sampling plan was adjusted in some cases. For more information on specific countries and jurisdictions and sample sizes, see pages 9-16.

the 2025 *WJP Rule of Law Index*. The remaining countries will be updated with nationally representative polling data in future editions of the Index. Depending on the polling conditions of each country, one of three different methodologies is used: face-to-face, online, or telephone. The GPP has been carried out in each country every few years. The polling data used in this year's report was collected during spring 2025 (for two countries), spring 2024 (for 28 countries), summer 2023 (for two countries), fall 2021 through summer 2022 (for 21 countries), fall 2020 through summer 2021 (for 16 countries), fall 2019 (for five countries), fall 2018 (for 56 countries), fall 2017 (for 42 countries), fall 2016 (for four countries), fall 2014 (for three countries), fall 2012 (for one country), and fall 2011 (for two countries). Detailed information regarding the country coverage (cities surveyed or nationally representative), the polling companies contracted to administer the questionnaire, and the polling methodology employed in each of the 143 countries and jurisdictions is presented on page 9.

The QRQs complement the household data with assessments from in-country practitioners and academics with expertise in civil and commercial law; constitutional law, civil liberties, and criminal law; labor law; and public health. These questionnaires gather timely input on a range of topics from practitioners who frequently interact with state institutions. Such topics include information on the efficacy of courts, the strength of regulatory enforcement, the accessibility of public health resources, and the reliability of accountability mechanisms.

The questionnaires contain closed-ended perception questions and several hypothetical scenarios with highly detailed factual assumptions aimed at ensuring comparability across countries. The QRQ surveys are conducted annually, and the questionnaires are completed by respondents selected from directories of law firms, universities and colleges, research organizations, and non-governmental organizations (NGOs), as well as through referrals from the WJP global network of practitioners. All qualified respondents are vetted by WJP staff based on their expertise. The expert surveys are administered in seven languages: Arabic, English, French, Portuguese, Russian, Spanish, and Thai. In order to improve the accuracy of the QRQ results and reduce respondent burden, proactive dependent interviewing techniques are used to remind returning respondents who participated in the previous year's survey of their responses from the year prior. The QRQ data for this report includes more than 4,100 surveys, which represents an average of about 29 responses per country. This data was collected from February 2025 through June 2025.

Data Cleaning and Score Computation

Once collected, the data is carefully processed to arrive at country-level scores. As a first step, the respondent level data is edited to exclude partially completed surveys, suspicious data, and outliers (which are detected using the Z-score method). Individual answers are then mapped onto the 44 sub-factors of the Index (or onto the intermediate categories that make up each sub-factor), codified so that all values

fall between 0 (weakest adherence to the rule of law) and 1 (strongest adherence to the rule of law), and aggregated into question level indicators at the country level using the simple (or unweighted) average of all respondents.

To allow for an easier comparison across previous years of Index data, the resulting 2025 scores are normalized using the Min-Max method with a base year of 2015. These normalized scores are then successively aggregated from the variable level all the way up to the factor level to produce the final country scores (rounded to two decimal points) and rankings. In most cases, the GPP and QRQ questions are equally weighted in the calculation of the scores of the intermediate categories (sub-factors and sub-sub-factors).

For a full picture of how questions are mapped onto indicators and how they are weighted, WJP's Variable Map is available for download on the *WJP Rule of Law Index* web page at https://worldjusticeproject.org/rule-of-law-index/downloads/ROLIndex2024_Table_of_Variables.pdf.

Data Validation

As a final step, data is validated and cross-checked against third-party sources to provide an additional layer of analysis and to identify possible mistakes or inconsistencies within the data. During this step, WJP references over 90 quantitative data sources and a broad range of qualitative resources, including reports and analyses from renowned international civil society and non-governmental organizations as well as numerous international and local news sources for each country. Many

of the third-party data sources used to cross-check the Index scores are described in Botero and Ponce (2011).²

Methodological Changes to this Year's Report

Every year, the WJP reviews the methods of data collection to ensure that the information produced is valid, useful, and continues to capture the status of the rule of law around the world. To maintain consistency with previous editions and to facilitate tracking changes over time, this year's questionnaires and data maps are closely aligned with those administered in the past.

This year, no new questions or indicators were added to the Index. Overall, 100 percent of questions remained the same between the 2024 and 2025 editions of the Index. A description of the variables is available at worldjusticeproject.org.

Tracking Changes over Time

The Index includes a measure to illustrate whether the rule of law in a country, as measured through the factors of the *WJP Rule of Law Index*, has changed since the previous year. On each country profile, score changes are presented in the form of arrows and represent a summary of rigorous statistical testing based on the use of bootstrapping procedures. For each factor, statistically significant improvements and deteriorations in score are marked with an asterisk. This measure complements the numerical scores and rankings presented in this report, which benchmark each country's current performance on the factors and sub-factors of the

2. Botero, J. and Ponce, A. (2011) "Measuring the Rule of Law": WJP Working Paper No. 1, available at <https://worldjusticeproject.org/our-work/publications/working-papers/measuring-rule-law>

Index against that of other countries. The measure of change over time is constructed in three steps:

1. First, last year's scores are subtracted from this year's to obtain the annual difference in scores for each country and each factor.
2. To test whether the annual changes are statistically significant, a bootstrapping procedure is used to estimate standard errors. To calculate these errors, 100 sample sizes of respondent-level observations (of equal size to the original sample) are randomly selected with replacement for each country from the pooled set of respondents for last year and this year. These samples are used to produce a set of 100 country-level scores for each factor and each country, which are utilized to calculate the final standard errors. These errors—which measure uncertainty associated with picking a particular sample of respondents—are then employed to conduct pair-wise t-tests for each country and each factor.
3. Finally, to illustrate the annual change, a measure of change over time is produced based on the value of the annual difference and its statistical significance (at the 10 percent level).

Using the WJP Rule of Law Index

The *WJP Rule of Law Index* is designed to offer a reliable and independent data source for policy makers, businesses, non-governmental organizations (NGOs), and other stakeholders to assess a country's adherence to the

rule of law as perceived and experienced by the average person, identify a country's strengths and weaknesses in comparison to similarly situated countries, and track changes over time. With unique features such as its wide-ranging coverage of rule of law topics and comparability over time, the Index distinguishes itself as a valuable resource that can inform policy debates both within and across countries.

Among its strengths is the inclusion of expert and household surveys to ensure that the findings reflect the conditions experienced by the population. By triangulating information across data sources and types of questions, the Index's measurement approach not only accounts for different perspectives on the rule of law but also reduces possible bias that might be introduced by any other data collection method.

Additionally, the Index relies on statistical testing to determine the significance of the changes in the factor scores over the last year. In the Econometrics and Applied Statistics Unit of the European Commission's Joint Research Centre's most recent statistical audit of the Index's methodology, authors Matija Kovacic and Giulio Caperna conclude that "the ROLI is a reliable tool, and that the framework has a good statistical coherence and a robust structure."³

The Index's findings must also be interpreted considering certain inherent limitations. Policymaking related to the rule of law should take into account a combination of sources, instruments, and methods, and requires careful consideration of all relevant and country-specific variables. As such, the

3. Kovacic, M. and Caperna, G. (2022) "Joint Research Centre Statistical Analysis of the World Justice Project Rule of Law Index 2021 (ROLI)", available at <https://publications.jrc.ec.europa.eu/repository/handle/JRC131884>.

Index is generally intended to be used in tandem with other quantitative and qualitative instruments. Just as in the areas of health or economics, no single index conveys a full picture of a country's situation. The *WJP Rule of Law Index* is not intended to establish causation or ascertain the complex relationship among different rule of law dimensions in various countries. The scores and rankings of the Index provide an overview of rule of law dimensions that appear relatively strong or weak, but it is necessary to use the Index alongside other analytical tools to provide a full picture of causes and possible solutions for a country's rule of law issues.

Indices and indicators are subject to potential abuse and misinterpretation. Once released to the public, the data is openly accessible and can be used for purposes unanticipated by the researchers. If data is taken out of context, it can lead to unintended or erroneous policy decisions. Rule of law concepts measured by the Index may have different meanings across countries, so users are encouraged to consult the specific definitions of the variables employed in the construction of the Index. These are discussed in greater detail in the methodology section of the [WJP Rule of Law Index website](#).

Safeguards Against Measurement Error

The Index's scores and rankings are the product of a rigorous data collection and aggregation methodology. Nonetheless, as with all measurements, they are subject to measurement error.

To safeguard against the potential for error, WJP has examined limitations associated with its data collection methods and

taken measures to reduce such errors.

In previous editions of the Index, General Population Poll (GPP) data was only gathered from three major urban areas in each of the indexed countries. The World Justice Project has changed this methodology to include nationally representative polls, currently reflected in 115 of the indexed countries and jurisdictions, and the remaining countries will be updated in future editions of the Index. Additionally, Qualified Respondents' Questionnaire (QRQ) data may be subject to problems in measurement error due to the limited number of experts in some countries, resulting in less precise estimates. To address this, the WJP works constantly to expand its network of in-country academic and practitioner experts who contribute their time and expertise to this endeavor. Given the uncertainty associated with picking a particular sample of respondents, standard errors have been calculated using bootstrapping methods to test whether the annual changes in the factor scores are statistically significant.

Due to the fact that changes to the rule of law can occur rapidly, scores for certain countries may be sensitive to the specific period during which data was collected. To address this, the WJP is piloting test methods of moving averages to account for short-term fluctuations. However, it is possible that this test may not detect small changes in a country's situation over time due to the limited number of experts in some countries (which implies higher standard errors) and the fact that general population polls are administered in each country every few years (which implies that, for some countries, certain

variables do not change from one year to another).

Pursuant to the sensitivity analysis of the Index data conducted in collaboration with the Econometrics and Applied Statistics Unit of the European Commission's Joint Research Centre, confidence intervals have been calculated for all figures included in the *WJP Rule of Law Index*. These confidence intervals and other relevant considerations regarding measurement error are reported in Kovacic and Caperna (2022)⁴ and Botero and Ponce (2011).

Additional Methodological Resources

A detailed presentation of the methodology, a table and description of the 550+ variables used to construct the Index scores, and the questionnaires used to collect the data are available at: <https://worldjusticeproject.org/rule-of-law-index/about>. To learn more about the development of the Index, please refer to Botero, J. and Ponce, A. (2011) "Measuring the Rule of Law": WJP Working Paper No.1, available at: <https://worldjusticeproject.org/rule-of-law-index/about>.

The following pages (9 – 16) list the coverage and polling methodology for the GPP in the 143 indexed countries and jurisdictions.
